

Attendance Calculation Guide

This document explains how the SmartFace attendance percentage is calculated in the system, in simple terms you can share with a manager.

1. What counts as attended

The system counts **Present** and **Late** as attended days. It does not matter whether the entry was marked by face recognition or manually; the status is what matters.

Attended days = Present days + Late days

2. What counts as absent

Absent includes two cases: a day that was explicitly marked **Absent**, and a completed day that was not marked at all. Pending days are not counted yet.

Marked days = Present days + Late days + Absent days

3. Main formula

Attendance % = (Attended Days / Finalized Days) × 100

In the dashboard code, finalized days are the days already closed for calculation. Current or future days show as pending and are excluded from the percentage until the day is finalized.

4. Current dashboard example

Metric	Value	Meaning
Monthly snapshot	54.8%	17 attended out of 31 finalized days
Yearly snapshot	29.2%	26 attended out of 89 finalized days

5. Average check-in time

The dashboard also calculates an average check-in time. It takes every **Present** and **Late** record, converts the time to minutes, averages them, and converts the result back to a time string.

6. Short manager explanation

We consider a student attended when they are marked Present or Late. We only calculate attendance using finalized school days; pending days are excluded. The attendance percentage is the number of attended days divided by finalized days, multiplied by 100. This makes the metric stable and fair because unfinished days do not distort the result.
